The HLA System

- Human genome encodes Leukocyte Antigen (HLA) loci
- HLA are transcribed into cell surface proteins responsible for immune response
- Evolutionary benefit for species to have highly variable HLA gene region

Why sharing HLA data?

- In transplantation, mismatched donor-HLA impairs outcome
- Recent technologies refine understanding of "match" or "mismatch" (i.e. epitope matching)
- These technologies are computationally expensive
 - not feasible to run locally at hospital
 - provided as a Cloud service

...so we share HLA data with 3rd parties.

Legal implications

- HLA data of a patient is not obvious
- HLA data is however a powerful composite identifier

- HIPAA considers HLA data as de-identified (i.e. not protected health information)
- PIPEDA requires “no serious possibility” of re-identification
- GDPR considers HLA as pseudonymized

- Anonymized data not in the scope of GDPR

Is that a thing? Example

- Neighbor told me...
 - he's on dialysis, waiting for kidney transplantation
 - mother is Japanese, father African American *HLA haplotye frequency tables*

- Listening to incoming HLA data may allow to
 - learn when an organ offer was made to my neighbor *IP address/user*
 - learn about the HLA typing of the donor *Time of request*
 - learn about ethnicity of the donor *Look up donor in haplotype frequencies*
 - learn about history of the donor *Patient donor linkage*
Aggregate with local news articles

Anonymization Strategy

- Binning data „destroys“ information
 - Not desired when applying highly sensitive prediction method
- Perturbation „buries“ the real data in counterfeit records

„Let's produce some random data...“

- Attack 1 – domain-specific knowledge attack: HLA follows linkage disequilibrium
- Attack 2 – repeated request attack: filtering random data and remain the real data
- Attack 3 – dictionary attack: map all potential HLA genotypes to obfuscated data and reverse the inputs
- Attack 4 – family donor attack: repeated requests may indicate living donation, extract overlapping haplotypes as patients are probably related
- Attack 5 – typing level knowledge: knowing about the typing methods applied in the lab, certain anonymized values are not plausible
- Attack 6 – typing level difference: labs apply different methodologies depending on the transplant setting (living/deceased, historic vs. current)

Conclusion

- Sharing HLA data with (trusted) vendors is fine by current legislation (HIPAA, PIPEDA and GDPR)
- Currently no public datasets available to map HLA

- But...
 - there is value to extract from pseudonymized data
 - data can be aggregated with certain assumptions
 - more data sources may become available
